

Creating Unified Login for multiple single tenant EHR instances

Given the single tenant nature of our platform, users must currently know their specific URL for interacting with our software. For example, a user at practice 1, has to know that they should visit <https://practice1.brydonhealth-ehr.com> rather than <https://brydonhealth-ehr.com>. The same is true of providers utilizing our EHR.

As a stepping stone toward a true multi-tenant deployment, to ease the acute pain felt by our users, we have built this intermediary solution. We will create a user experience that supports users navigating directly to <https://brydonhealth-ehr.com> and signing in without knowing their practice's URL.

To support this, we have built a new service called tenant-router. Its job is to know how to direct the login process to the proper tenant. Each tenant reports its roster to the tenant-router to serve as a source of truth for tenant membership. Both patient-portal and marketing-website utilize the information stored in tenant-router as part of their respective login process.

Below shows a simplified diagram of how the pieces of the system connect to achieve this.
